

KOICA · SMEDAN — AI PRODUCT WORKSHOP

Product Validation Techniques using Codex & G_Stack

Pressure-test the idea before you build it — a repeatable, agent-driven flow.

Presented by

Teddy Aitan, Ph.D.

THE PROBLEM

Validate before you build a single line of code

THE TRAP

“A blank chat gives you polite praise — not the truth.”

- You build for months on an untested guess
- Feedback is flattering, not honest
- The market never actually asked for it

THE SHIFT

Forcing questions expose your assumptions first.

- ✓ **Interrogate demand**
Is the pull real, or wishful?
- ✓ **Find the sharp wedge**
The narrowest way to win first
- ✓ **Decide on evidence**
Observed behaviour beats opinions

Three tools, one validation flow

Codex

OpenAI

Your agentic workspace and terminal. It runs tasks, edits files and holds the project that everything else references.

Antigravity

Google

Agent-first IDE built on Gemini. Agents generate Markdown “artifacts” — plans and walkthroughs you keep and reuse.

G_Stack

Garry Tan · YC

Open-source (MIT) validation skills for coding agents. /office-hours pressure-tests the idea before any code.

The flow: capture knowledge → pressure-test the idea → decide what to build first.

Four steps from idea to strategy

01

Set up the folder

One shared project folder for you, Codex & Antigravity.

02

Capture knowledge

Turn your product into a single .MD source of truth.

03

Run office-hours

Feed G_Stack the .MD and work the six questions.

04

Output strategy.MD

The validated design doc that green-lights the build.

01

STEP 1

Create the shared project folder

Make one folder on your Desktop

e.g. Desktop / Product-Validation. This is the single home for every file.

Make it the shared reference

You, Codex and Antigravity all read and write here — nothing gets lost.

Open the folder as a Project in Codex

Point Codex at the folder so the agent works inside it from the start.

PROJECT ROOT

Product-Validation

domain.md

strategy.md

artifacts /

walkthrough.md

plan.md

02

STEP 2

Capture your product as domain knowledge

1

Start from what exists

Use your product website or your MVP Build Sheet as the raw source.

2

Write it into one Markdown file

Create domain.md — clear, structured, the single source of truth.

3

Attach it to the project directory

Drop the .MD in the folder so every agent can read the same facts.

```
domain.md
```

```
# Product: <your product>
```

```
## Problem
```

```
Who hurts, and how much.
```

```
## Target user
```

```
The specific person / segment.
```

```
## Offer / service
```

```
What you actually deliver.
```

```
## How it works
```

```
The flow, in plain steps.
```

03

STEP 3

Run G_Stack /office-hours

Upload domain.md, paste the GSTACK prompt with your product statement, and run. Work every question until you reach consensus — the office-hours gate. No code until then.

1

Demand reality

Is the pull real — would people miss it if it vanished?

2

Status quo

What do they honestly do today instead?

3

Desperate specificity

Exactly who needs this most — name, role, why.

4

Narrowest wedge

The smallest sharp entry you can win first.

5

Observation

Evidence from real behaviour, not opinions.

6

Future-fit

Why now — the trend this idea rides.

04

STEP 4

Your output: strategy.MD

Office-hours writes a design doc

Save / rename it strategy.md inside your project folder.

It captures the decision

Validated wedge, target user, demand evidence, positioning, next step.

It feeds the next stages

CEO review → eng review → build — all downstream skills read it.

strategy.md

Validated Strategy

Wedge: narrowest first win

User: the desperate buyer

Demand: observed evidence

Beats: the status quo

Now: why the timing fits

→ **Build this first.**

THE GREEN-LIGHT TEST

You've reached consensus when...

You can name the exact person who is desperate for this

The wedge is narrow enough to win in weeks, not years

Demand is pulled by evidence — not pushed by hope

The status-quo alternative is clearly beaten

The doc says what to build first — and what to ignore

KEY TAKEAWAYS

What to walk away with

Knowledge first

One .MD file is your product's single source of truth.

Pressure-test, don't flatter

Office-hours beats blank-chat praise every time.

Decide on paper

strategy.MD is the artifact that green-lights the code.

Reusable everywhere

The same flow works for every product and engagement.

Validate before you build.

Capture it. Pressure-test it. Then — and only then — build it.
